# Selecting the best animals as parents

countries. They have become widely disseminated in Sweden and Norway, and there are now control associations in Finland, Russia, Germany and Scotland. In most places an attempt is made to carry out the weighing and valuation of the feed, as in Denmark; but, in some parts of Norway, where the cows subsist entirely on grass in the summer and on hay and straw in the winter, it is thought that the estimate of the feed will be too inaccurate, and therefore the work of the control assistant is limited to managing the test milking, testing for butter fat, and keeping a record of the milk and butter yield.

Where there is no record of the consumption of feed, there will be no basis for a fair comparison of the milk and butter yield in the various herds, because the amount of feed will always affect the yield of butter; but, even without a record of the feeding, the "control" will give every farmer valuable information regarding the yield of milk and butter of the individual cows, so that he can positively distinguish the best, the good, and the poor cows; and he gets an opportunity to find those cows that give particularly rich milk, which is of immense importance, if it is, as we believe, that giving rich or poor milk is for each cow a peculiar and inherited quality.

Note.—

1 pound, Danish, is the same as 1.12 English.

1 Krone = \$268.

1 Ore =  $\frac{1}{100}$  Krone =  $\frac{1}{4}$  cent.

[Presented by the Committee on Cooperation in Animal Breeding.]

Translated from the Danish manuscript.

## COW-TESTING ASSOCIATIONS.

COLON C. LILLIE, *Coopersville, Mich.*

A cow-testing association is a cooperative business association among the dairy farmers of a community for the purpose of testing their cows for economical production. Each cow is charged with the food she consumes and given credit for the butter fat she produces for the entire year at market prices. A competent person is employed by the association to go from farm to farm and weigh and compute the ration, weigh and test the milk and keep accurate records of the same.

# History of breeding dairy cattle

- 1930-1990s: selection for production traits (and conformation traits)

# History of breeding dairy cattle

- 1930-1990s: selection for production traits (and conformation traits)
- 1990-...: fertility, SCS, longevity

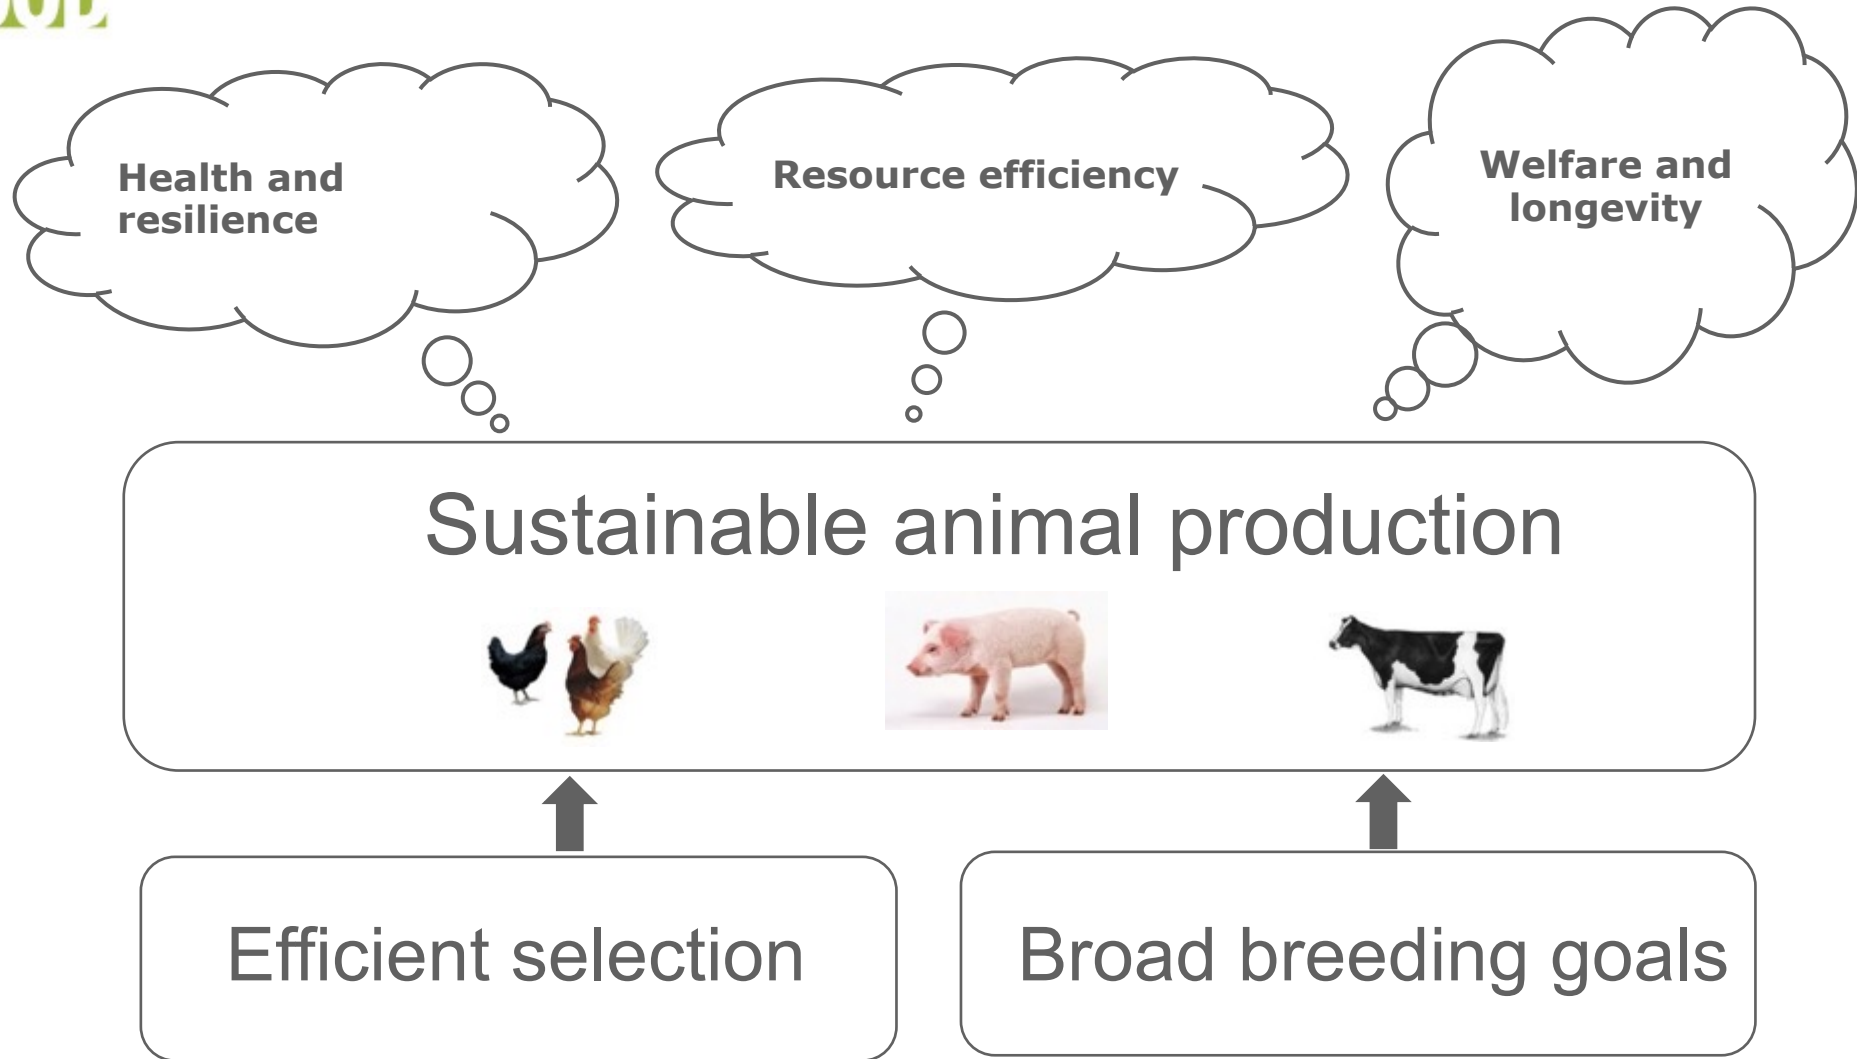

# Breed4Food

# Focus areas for phenotyping

## 1. Health and resilience

- Locomotion
- DNA pooling
- Microbiome
- Mortality
- Resilience
  - Cattle – milk production
  - Turkey – feed intake

# Genetic selection for resilience

**AIM:** To develop resilience indicators for dairy cattle that can assist in genetic selection for improved resilience

...using daily milk yield records

Low variance  
&  
low autocorrelation

High variance  
&  
high autocorrelation

# Conclusions resilience indicators

- We can select for resilience in dairy cows using resilience indicators based on daily milk yield records
  - Heritable
  - **Variance** genetically associated with:
    - Health & longevity
    - Strength of response to actual disturbances
  - **Autocorrelation** genetically associated with:
    - Recovery rate after actual disturbances
- Combination of variance & autocorrelation → improve all aspects of resilience

WAGENINGEN  
UNIVERSITY & RESEARCH

# Focus areas for phenotyping

## 2. Resource efficiency

- Organoids
- Digestibility
- Infrared thermography
- Protein efficiency

# Focus areas for phenotyping

## 3. Welfare and longevity

- Tracking and monitoring
  - Broilers
  - Cattle
  - Pigs

# Tracking broilers for activity

- RFID tag in leg band
- 30 antennas in a grid underneath floor
- One sample per second
- From hatching onwards

# Monitoring activity throughout life

- RFID system is suitable
- Valuable for breeding programmes
- Keep track of individual health, welfare and performance
- Early intervention: detect or even predict problems early on

# Focus areas for phenotyping

## 4. Environmental impact

- Methane emissions
- N & P efficiency
- Mineral losses

## 5. Big data

- Hackathon machine learning
- Data lakes
- Cloud solutions
- Ploidyscreen

- feed efficiency

# Measuring enteric methane

- Spot sampling method, installed in feed bin of a milking robot, measures concentration (ppm)

- 😊 High throughput
- 😊 Non-invasive
- 😊 Cost-effective
- 😞 Lower precision

# Future

# To serve animal husbandry & society

Precision phenotyping enables to:

- Record new traits that are important for consumers & society
  - Health, Welfare
  - Environmental impact
- Record information to get a better / deeper understanding of existing traits
  - Efficiency
  - Fertility

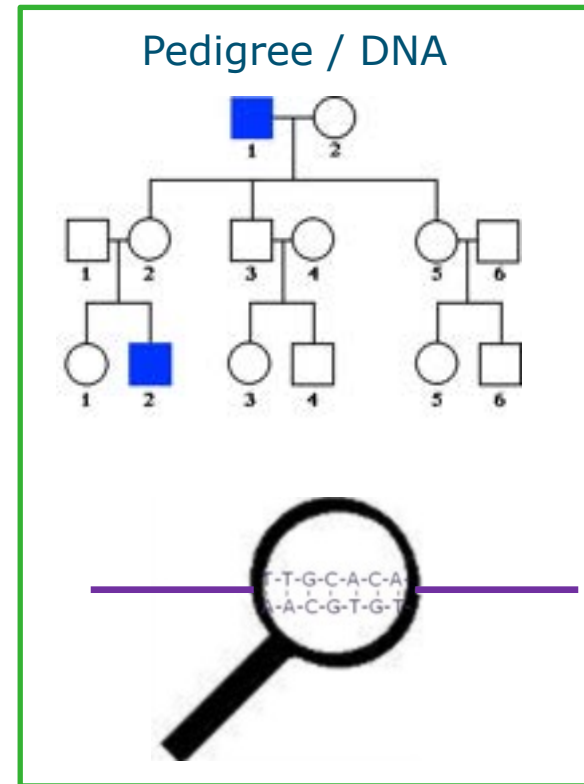

# Phenotyping interface

- Handling large-dimensional data
  - Aggregate from automated and (near) real-time data collection
- Link these data with genomic prediction pipeline

# Summary

- For genetic progress precision phenotyping remains important
- Only then you know which animals to select

Save the date: 29 September 2022

IMAGEN & Breed4Food Individual Tracking symposium  
on **automated phenotyping**

*Thursday the 29<sup>th</sup> of September 2022, full day*

*Hotel de Nieuwe Wereld, Wageningen*

*Interesting programme with national and international speakers*

*More information will follow*

## Highlights & Interaction

# Highlight 1

DNA pooling related to phenotyping

-

Marco Bink, HG

Michael Aldridge, WUR

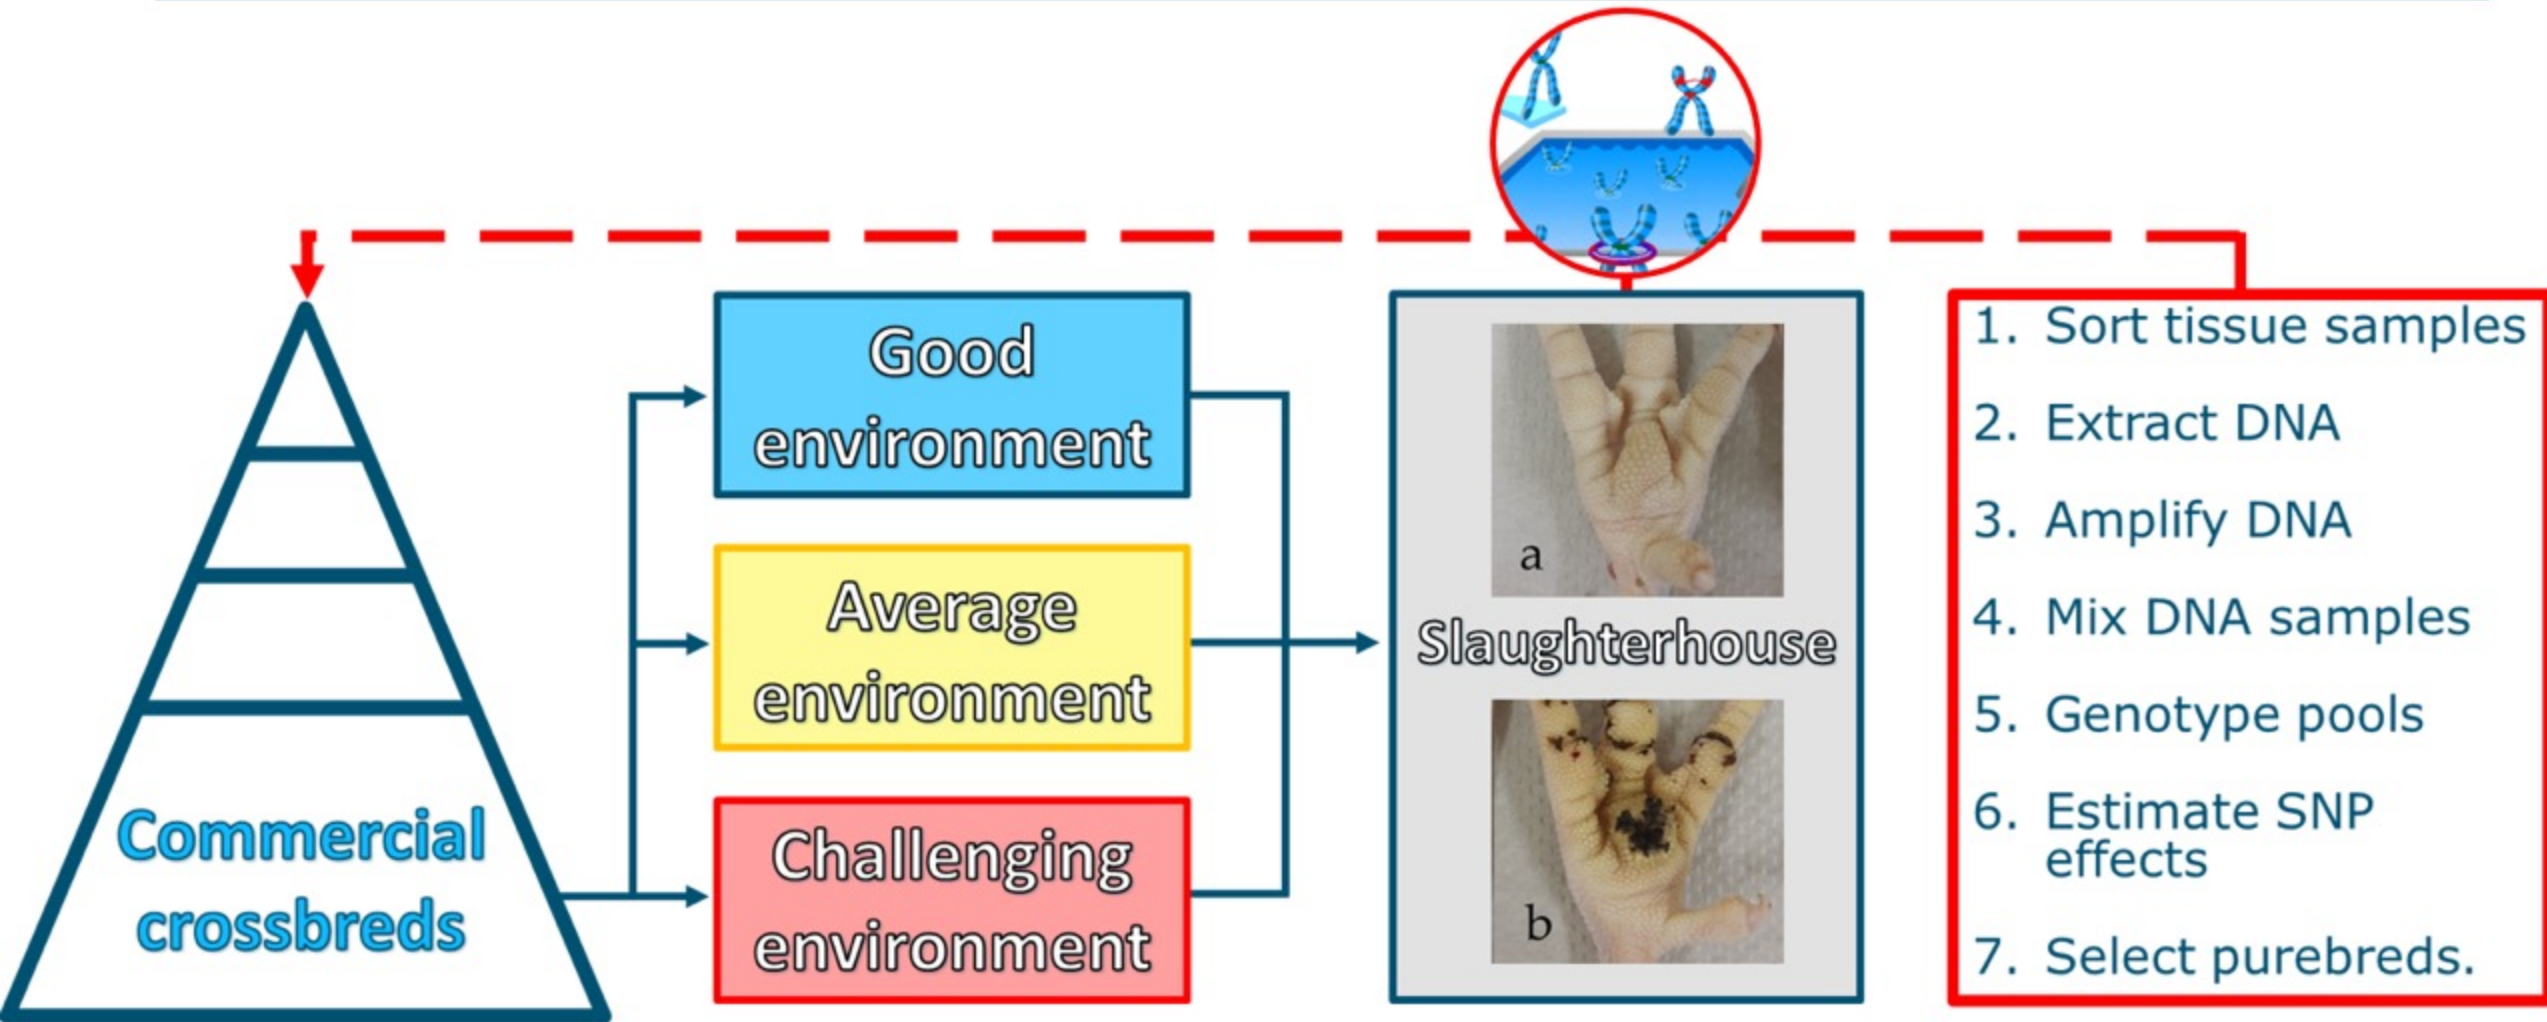

# DNA pooling

B4F 07/04/2022 - Michael Aldridge, J. Marjanovic, J.M. Henshall, B. de Klerk, K. Peeters, K. de Greef and Y. de Haas

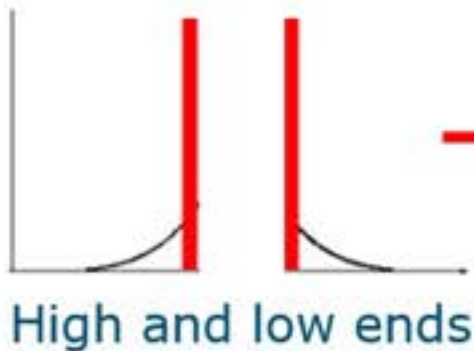

# DNA pooling – a cheap link to the purelines

# Summary of sampling

Repeat selection 10 times for each sampling strategy.

# What does this mean practically

Method	Accuracy	Bias	Cost per sample genotyped	Number of samples genotyped	Total cost
890 high/low	0.62	0.98	€28	890 (890)	€24,920
426 high/low	0.42	0.74	€28	426 (426)	€11,928
58 high/low	0.14	0.24	€28	58 (58)	€1,624
<hr/>					
Pool size 5 (25%)	0.51	0.87	€29	890 (4,450)	€25,810
Pool size 5 (20%)	0.51	0.87	€29	706 (3,530)	€20,474
Pool size 5 (10%)	0.46	0.79	€29	342 (1,710)	€9,918
Pool size 10	0.49	0.83	€30	426 (4,260)	€12,780
Pool size 50	0.45	0.76	€38	58 (2,900)	€2,204

# Highlight 2

## Behaviour analysis in dairy cattle

-

Erik Mullaart, CRV

Ines Adriaens, WUR

# Quantification of animal behaviour

For **breeding**:

- Large scale phenotyping
- Complex traits
- Animal-in-environment

For **monitoring**:

- (early) disease detection
- Welfare assessment
- Recovery & cure
